

## LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

### A) SIMPLIFYING EXPRESSIONS

An expression does not have an equal sign with a left side and a right side.  
In an expression we can only simplify rather than solve.

Simplify each expression:

1)  $13x + 5x - 7 + 1$

**$18x - 6$**

2)  $8 - 5(6x - 2)$

$8 - 30x + 10$

**$18 - 30x$**

3)  $4 - (2x + 7)$

$4 - 2x - 7$

**$-3 - 2x$**

- 4) Which of the following expressions is equivalent to the expression  $17 - 4x$  for all values of  $x$ ?

**e)  $5 - (4x - 12)$**

$$\begin{aligned} & 5 - (4x - 12) \\ &= 5 - 4x + 12 \\ &= 17 - 4x \end{aligned}$$

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

5) Which of the following is equivalent to  $14x^2$ ?

Choose all correct answers.

a)  $10x^2 + 9x^2 - 5x^2$

b)  $(2x)(7x)$

d)  $\frac{42x^3}{3x}$

a)  $10x^2 + 9x^2 - 5x^2 = 19x^2 - 5x^2 = 14x^2$

b)  $(2x)(7x) = 14x^2$

d)  $\frac{42x^3}{3x} = 14x^2$

			<b>A</b>				
			6				
			9				
<b>B</b>	12	5	X	1	3		
			Y				
			3				

6) If the sum of the numbers in column A is equal to the sum of the numbers in row B, then find the value of Y.

$6 + 9 + X + Y + 3 = 12 + 5 + X + 1 + 3 =$   
 $18 + X + Y = 21 + X$  Subtract X from both sides.  
 $18 + Y = 21$   
 $Y = 3$

3

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

B) MORE SOLVING EQUATIONS

Remember, when solving an equation, always do **ADDING** & **SUBTRACTING**

first. To remove a fraction, multiply by the **RECIPROCAL**.

1) If  $\frac{1}{8}x - 5 = 3$ , then  $x =$

**b) 64**

$$\begin{aligned}\frac{1}{8}x - 5 &= 3 \\ \frac{1}{8}x &= 8 \\ 8\left(\frac{1}{8}x\right) &= 8(8) \\ x &= \mathbf{64}\end{aligned}$$

2) "Type" the number in the box. Give your answer as a fraction.  
If  $7(3x - 5) = 4(x - 4) - 9$ , what is the value of  $x$ ?

$$\begin{aligned}7(3x - 5) &= 4(x - 4) - 9 \\ 21x - 35 &= 4x - 16 - 9 \\ 21x - 35 &= 4x - 25 \\ 17x - 35 &= -25 \\ 17x &= 10 \\ x &= \frac{\mathbf{10}}{\mathbf{17}}\end{aligned}$$

$$x = \frac{\mathbf{10}}{\mathbf{17}}$$

3) Which of the following sequence of steps, when completed, will solve the equation  $4 + 5y = 19$  for  $y$ ?

**a) Subtract 4 from both sides of the equation, then divide both sides of the new equation by 5.**

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

4) If  $k + m = 41$  and  $j + p = 20$ , what is the value of  $(4k + 4m)(3j + 3p)$ ?

**a) 9840**

$$\begin{aligned} \text{Since } k + m &= 41, \\ 4k + 4m &= 4(41) = 164 \end{aligned}$$

$$\begin{aligned} \text{Since } j + p &= 20, \\ 3j + 3p &= 3(20) = 60 \end{aligned}$$

$$\begin{aligned} (4k + 4m)(3j + 3p) \\ = (164)(60) = \mathbf{9840} \end{aligned}$$

5) If  $8a - 5b = 44$  and  $b = 2$ , find  $a$ .

**c)  $\frac{27}{4}$**

$$8a - 5b = 44$$

$$8a - 5(2) = 44$$

$$8a - 10 = 44$$

$$8a = 54$$

$$a = \frac{54}{8} = \frac{27}{4}$$

6)  $30\left(\frac{1}{10}x + \frac{2}{3}x\right) = ?$

$$\begin{aligned} 30\left(\frac{1}{10}x + \frac{2}{3}x\right) &= \frac{30}{1} \cdot \frac{1}{10}x + \frac{30}{1} \cdot \frac{2}{3}x \\ &= \frac{30}{10}x + \frac{60}{3}x = 3x + 20x = \mathbf{23x} \end{aligned}$$

**23x**

7) Solve for  $y$ :  $\sqrt{y+3.7} + 18 = 30$

$$\sqrt{y+3.7} + 18 = 30$$

$$\sqrt{y+3.7} = 12 \quad \text{square both sides}$$

$$\left(\sqrt{y+3.7}\right)^2 = (12)^2$$

$$y + 3.7 = 144$$

$$y = \mathbf{140.3}$$

**140.3**

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

- 8) Given the fraction  $\frac{x}{x+11}$ . If 7 is added to the numerator and the denominator, the resulting fraction is  $\frac{9}{20}$ . What is the value of  $\frac{x}{x+11}$ ?

Since 7 was added to the numerator and denominator, simply reverse the process and subtract 7 from both.

$$\frac{9-7}{20-7} = \frac{2}{13}$$

$$\frac{\boxed{2}}{\boxed{13}}$$

- 9) Nishanka has twice as many coins as Paola. Brenda has 5 more coins than Nishanka. If the total number of coins is 50, how many coins does Brenda have?

Let **P** = # of coins Paola has  
 Let **2P** = # of coins Nishanka has  
 Let **2P + 5** = # of coins Brenda has

$$\begin{aligned} P + 2P + 2P + 5 &= 50 \\ 5P + 5 &= 50 \\ 5P &= 45 \\ P &= 9 \end{aligned}$$

Paola has 9 coins  
 Nishanka has  $2(9) = 18$  coins  
 Brenda has  $18 + 5 = 23$  coins

e) 23

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

x	f(x)
4	50
7	65
10	80
12	90
35	205

- 10) Which equation satisfies every entry in the above table?

e)  $f(x) = 5x + 30$

Use trial and error.

Ex.a)  $f(x) = 10x + 10$  so if  $x = 4$ , then  $10(4) + 10 = 50$  so it "satisfied" the first one.

Then try  $x = 7$

$10(7) + 10 = 80$ , not 65, so it does not "satisfy" the second one.

Eventually you will find that e)  $f(x) = 5x + 30$  will work for all pairs of numbers.

$$5(4) + 30 = 50$$

$$5(7) + 30 = 65$$

$$5(10) + 30 = 80 \text{ etc.}$$

- 11) A repairperson charges \$70/hour plus a service charge of \$170. If the bill came to \$800, which of the following will find the number of hours she worked?

a)  $\frac{800 - 170}{70}$

Let  $x = \#$  of hours worked

$$70x + 170 = 800$$

$$70x = 800 - 170$$

$$800 - 170 = 70x$$

$$x = \frac{800 - 170}{70}$$

C) SOLVING PROBLEMS WITH LOTS OF LETTERS

- 1) Sheryl deposits \$2,800 in her bank. It is all in twenties and fifties. If z represents the number of twenty dollar bills, which of the following represents the number of fifty dollar bills?

c)  $\frac{2800 - 20z}{50}$

We need to make up a letter to stand for the number of fifty dollar bills.

Let f = # of fifty dollar bills

$20z + 50f = 2800$  Now solve for f.

$$50f = 2800 - 20z$$

$$f = \frac{2800 - 20z}{50}$$

- 2) If  $x + 2 = 3y + 6$ , **what is y** in terms of x?

d)  $\frac{x - 4}{3}$

$x + 2 = 3y + 6$  Solve for y.

$$\begin{array}{r} x + 2 = 3y + 6 \\ -6 \quad -6 \\ \hline \end{array}$$

$$x - 4 = 3y$$

$$\frac{x - 4}{3} = \frac{3y}{3}$$

$$y = \frac{x - 4}{3}$$

- 3) If  $8x + 113y = 501$ , **find x** in terms of y.

b)  $\frac{501 - 113y}{8}$

Solve for x:

$$8x + 113y = 501$$

$$8x = 501 - 113y$$

$$x = \frac{501 - 113y}{8}$$

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

$$16x + 34y$$

- 4) The expression above represents the total amount, in dollars, earned by selling  $x$  tee shirts and  $y$  sweatshirts at a recent Back-To-School Night. A total of \$2,260 was collected in sales of tee shirts and sweatshirts. The amount earned by selling **sweatshirts (34y)** is what fraction of the **total amount earned (\$2,260)**?

a)  $\frac{34y}{2260}$

$$\frac{\text{amount \$ for sweatshirts}}{\text{total amount of \$}} = \frac{34y}{2260}$$

- 5)  $H$  is 5 times  $M$ , and  $M$  is 3 less than 7 times  $W$ . Which of the following statements describes the relationship between  $H$  and  $W$ ?

e)  $H$  is 15 less than 35 times  $W$ .

**$H = 5M$     $M = 7W - 3$**  (Remember 3 less than means take 3 away from!)

**Replace  $M$  with  $7W - 3$**

**$H = 5(7W - 3)$**

**$H = 35W - 15$**

- 6) If  $h = \frac{1}{3}j$  and  $j = \frac{1}{4}k$ , what is the relationship between  $h$  and  $k$ ?

**d)  $k = 12h$**

$h = \frac{1}{3}j$     $j = \frac{1}{4}k$

$h = \frac{1}{3}\left(\frac{1}{4}k\right)$

$h = \frac{1}{12}k$  but this is not a choice.

**So multiply both sides by 12 to get:**

$12(h) = 12\left(\frac{1}{12}k\right)$

**$12h = k$  or  $k = 12h$**

## D) INEQUALITIES

One important thing to remember about inequalities:

If I multiply or divide BOTH SIDES of an inequality by a

**NEGATIVE**, then I must **REVERSE THE INEQUALITY SYMBOL**!

Always put the letter on the **LEFT**. Don't write  $2 < x$ . Write  **$x > 2$** .

Solve each inequality for x:

1)  $2x + 7 > -13$

$$2x > -20$$

$$x > -10$$

2)  $-4x + 3 \leq x + 18$

$$-5x + 3 \leq 18$$

$$-5x \leq 15 \text{ Divide both sides by } -5!$$

$$x \geq -3$$

3) Solve the inequality for x. Choose all that apply.  
 $2x + 3 > 40$

c) 19     d) 19.5     e) 21

$$2x + 3 > 40$$

$$2x > 37$$

$$x > 18.5$$

**Note: It must be greater than 18.5 but it can't be equal to 18.5!**

4) Solve the inequality for x. Choose all that apply.  
 $-3x - 5 \geq 34$

$$-3x - 5 \geq 34$$

$$-3x \geq 39$$

$$x \leq -13$$

**Note: Now it can be less than or EQUAL to -13.**

a) -14.5     b) -14     c) -13.9     d) -13

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

E) ALGEBRAIC GRAPHS

To find the points where a graph will hit the x and y axes, use the “Intercept-Intercept” Method. Let  $x = 0$  and solve for  $y$ . Let  $y = 0$  and solve for  $x$ .

Ex.  $2y - 4x = 8$

If  $x$  is 0, then  $2y = 8$   
 $y = 4$

If  $y$  is 0, then  $-4x = 8$   
 $x = -2$

1) Which is the correct graph of the equation:  $4x + 3y = 12$ ?

Let  $x = 0$ :  
 $3y = 12$   
 $y = 4$

Let  $y = 0$ :  
 $4x = 12$   
 $x = 3$

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

2) Which graph represents the equation:  $5x - 4y = 10$ ?

<p>Let <math>x = 0</math> :</p> $-4y = 10$ $y = \frac{10}{-4}$ $y = -2.5$
<p>Let <math>y = 0</math> :</p> $5x = 10$ $x = 2$

NOTE: The equation of all horizontal lines is  $y =$  the number where it hits the y-axis.  
 The equation of all vertical lines is  $x =$  the number where it hits the x-axis.

The equation of the line above is  $y = 4$ .

The equation of the line above is  $x = -2$ .

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

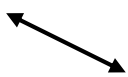

3) Which of the following graphs shows that as  $y$  decreases by 4,  $x$  increases by 1?

From the  $y$ -axis to the  $x$  axis you would go down 8 and right 2. This is equivalent to down 4 and right 1 or as  $y$  decreases by 4,  $x$  increases by 1.

**SLOPE-INTERCEPT FORM OF A LINE:**  $y = mx + b$  where  $m$  is the slope or rise/run and  $b$  is the  $y$ -intercept or place where the graph intersects the  $y$ -axis.

A positive slope rises to the right. 

A negative slope rises to the left. 

4) Which graph below shows the line  $y = 3x - 5$ ?

This line intersects the  $y$ -axis at negative 5 and has a slope of 3 over 1.

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

The line intersects the y-axis at 1 so  $b = 1$ .  
The slope is rise 3 and run to the left 4

or  $-\frac{3}{4}$ .

Equation:  $y = mx + b$

$$y = -\frac{3}{4}x + 1$$

5) What is the equation of the line shown in the graph above?

c)  $y = -\frac{3}{4}x + 1$

6) Which of the following linear models best fits the data shown in the scatterplot above?

d)  $y = \frac{1}{2}x + \frac{3}{2}$

The points are rising to the right so if a line were to be drawn through the points, it would have a positive slope. Therefore, the number in front of  $x$  must be positive. This eliminates choices  $a$  and  $b$ .

If we draw a line through these points it would hit the y-axis between 1 and 2. Choice  $d$  indicates a y-intercept of  $3/2$  or 1.5.

The correct answer is  $d$ .

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

- 7) The graph shows  $f(x) = (x - 3)^2 - 4$ .  
Which of the following is a point on  $f(x)$ ?

a) **(3, -4)**

- 8) Which of the following describes the graph of  $f(x)$  shown above?

d) **It is nonlinear and as  $x$  increases,  $y$  increases.**

4 people cost \$50, so that is \$12.50 per person....

- 9) The graph above shows the relationship between the cost of a luncheon and the number of people attending the luncheon. According to the graph, what is the cost per person?

c) **\$12.50**

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

- 10) Which of the following graphs most accurately shows the relationship between the time after a golf ball is struck and the height of the ball in feet?

**The ball is struck on the ground, then it rises into the air, then it falls back to the ground.**

- 11) We all know that the more time we spend studying for a test the higher our test score will be. Which of the following graphs could be the graph of the relationship between time studying and score on the CORE test?

**Graph c shows your score increasing as the amount of time studying increases!!**

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

12) The graph of a linear equation is shown above. Which of the following tables corresponds to the graph?

b)

x	y
6	10
12	17.5
24	32.5
30	40

For 0 hours, the cost is \$15 so that is the “flat rate”.

After 1 hour, the price is \$25. So,  $\$25 - \$15 = \$10$ .

Therefore the hourly charge is \$10.

13) The graph above represents the cost of renting a bike. What is the flat rate and what is the hourly charge?

**b) Flat rate \$15**

**Hourly rate \$10**

F) FUNCTIONS

In order to be a function, no x value can be repeated.

1) Which of the following is **not** a function?

d)  $\{(2,8)(-2,13)(1,5)(2,3)\}$

The x-value (the first number) 2 is repeated in (2,8) and (2, 3).

2) Which of the following does **not** represent a function?

This drawing represents:  
 $\{(6,9)(6,4)(2,1)(1,9)\}$   
If the x-value is repeated,  
it is **NOT** a function.

LESSON 2 **KEY** - ALGEBRA & FUNCTIONS

If you draw a vertical line anywhere on the graph and it intersects the graph more than once, then it is not a function.

3) Which of the following represents a function? Choose all correct answers.

A vertical line will only hit these graphs only one time.

4) Which of the following does not represent a function? Choose all correct answers.

A vertical line will hit these graphs more than one time.
